

BRAINWAVE 2026 · BLOCKCHAIN TRACK · RESUBMISSION

The marketplace where AI agents shop for tools.

A developer lists a paid API in 60 seconds. An agent finds it mid-task and pays a fraction of a cent. No signup, no API key, no human in the loop.

LIVE ON ALGORAND TESTNET

REAL USDC SETTLEMENTS

GOPLAUSIBLE FACILITATOR

An AI agent can reason, but it cannot buy.

Every API it wants sits behind a signup form built for a human. So agents work on a leash: somebody provisions keys in advance, and hopes.

THE BUYER

Cannot open an account

An agent that finds a useful API mid-task simply cannot use it.

THE SELLER

Cannot sell a half cent

Billing costs more than the call earns, so it never ships.

BOTH

Wrong shape entirely

Agents want thousands of tiny calls.
Subscriptions want one big commitment.

Payments work fine. This is a **market gap**: there is nowhere a machine can shop.

Two customers, one missing marketplace.

SUPPLY SIDE

The developer with an API

TODAY Has something worth \$0.005 a call. Building billing to sell it costs more than it earns.

WITH US A manifest and a price. Paid per call in USDC, with no account system to run.

DEMAND SIDE

The agent builder

TODAY Pre-provisions every key the agent might need, and pays monthly for tools it used twice.

WITH US Gives the agent a wallet and a budget. It buys what it needs and stops when the budget runs out.

More listings make the catalog worth shopping. More agents shopping makes it worth listing on.

Every call in between is a settled payment.

A marketplace, not a payment demo.

Browse and publish. 14 listings, each with a price, a schema and a payout address. Publishing is a manifest and a price.

Buy from anywhere. The web demo, a terminal, or an MCP client like Claude and Cursor. Plus a discovery API for agents.

Reputation is the payment. No reviews to game: standing comes from calls that settled on-chain.

Five steps, none of which involve a human.

The buyer needs USDC and a budget. **No account, no card, and no ALGO**, because the facilitator pays the network fee.

The rails got standardised. Nobody opened the shops.

FIRST Agents became buyers Tool use went from a demo to the default.	THEN x402 standardised payment A machine can be quoted a price and pay it in the same request.	THE GAP Almost nothing is for sale The protocol says how to pay. It does not create anything to buy.	
SETTLEMENTS / 24H 12,601 x402 payments already clearing	MERCHANTS 127 everyone selling, worldwide	ON ALGORAND 99% of all listed resources	FACILITATORS 1 the one we settle through

From the facilitator's own registry, 17 Aug 2026. Twelve thousand payments a day against 127 sellers is not a demand problem. **It is a supply problem, almost entirely on Algorand.**

One sentence in. Four paid tools out. Four cents.

THE LINE THAT MATTERS

Fee 0

The buyer's transfer pays nothing. GoPlausible's fee transaction sits in the same atomic group.

- **6 settlements** on Algorand testnet, all listed in [docs/PROOF.md](#)
- **Buyer's USDC** 20.0000 → 19.9590
- **Buyer's ALGO** 3.9990 → 3.9990, unchanged
- Also readable straight off the **public indexer**, not just an explorer we chose

The chain choice is a product decision.

WHAT THIS MARKET NEEDS	WHAT ALGORAND GIVES	WHY A USER FEELS IT
Prices that are actually prices	USDC as a native asset	\$0.005 is 5000 units, exactly. No oracle, no drift.
Buyers who hold one thing	Fee sponsorship in an atomic group	Onboarding drops from two assets to one.
Fees that do not eat the sale	A flat fee near zero	A \$0.002 call is viable. Elsewhere it is not.
Settlement inside a request	Instant finality	Payment fits inside the HTTP round trip.
Someone else to run the plumbing	A hosted facilitator	No key and no infrastructure of ours in the settlement path.

This project settled on another chain before, and the port took a chain abstraction rather than a rewrite. **The reasons above are why Algorand is now the default.**

We take a cut of what settles.

REVENUE MODEL

80 / 20

The publisher keeps 80%. We take 20%, and only on money that moved.

NO FLOOR

\$0.002 works

No minimum, no monthly fee, no invoice.

ALIGNED

Usage, not seats

A listing nobody calls costs us nothing and earns us nothing.

Why it compounds

- **Reputation cannot be moved** to a competitor, because it is made of settled payments.
- **Discovery is the moat.** Agents shop where the catalog is.
- **Every call is demand data** nobody else holds.

Where it honestly stands

- The split is **modelled in the dashboard**. On-chain, payment goes to one treasury today.
- Per-seller payouts are next, and need each seller to opt in once.
- Testnet only, by design.

We built the market. The protocol is the protocol.

Who does what

Price and payee	us
Build and emit the 402	x402ResourceServer
Sign the payment group	ExactAvmScheme
Verify, settle, sponsor the fee	the facilitator
Catalog, discovery, reputation	us

None of the payment protocol is reimplemented. All of it is `@x402-avm`, and all four packages sit on an executed path.

Built to outlive one chain

A chain picker in the nav. One click re-quotes every price, swaps the network and asset, and changes which signer moves the money.

2

WHERE IT STANDS

Shipped, and honest about the rest.

Working today

- 14 paid listings, discoverable by humans and machines
- Real x402 settlement in USDC on Algorand testnet
- An agent that plans, buys four tools and respects a budget
- CLI and MCP server, both ordinary x402 clients

Prototype	agentifyos.xyz
Agent demo	agentifyos.xyz/agent
Repo	github.com/0xWeb3Research/agentifyos

Next, in order

- **Wallet checkout** with Pera and Defly
- **Per-seller payouts**, so the split settles on-chain
- **Mainnet**, one environment variable away
- **Cross-market discovery**, every x402 seller
